

IBM® Datacap and Box

Capture documents to and from Box with automatic classification and data extraction to streamline business processes

The IBM Datacap integration with Box allows you to capture documents whenever and wherever they enter your organization for use in Box and business processes. For information already in Box, utilize Datacap's classification and content extraction to put that unstructured data to work for your organization. By identifying and putting your business content to work with Datacap, organizations can accelerate business processes, improve productivity and efficiency, and respond faster to customers while lowering costs.

Extract value from business content

With content entering organizations from multiple channels—mobile, MFPs, e-mail, fax and more—many customers struggle with how to ingest and digest documents, including what they already have stored in their repositories.

Datacap is the first step in putting documents to work for your business. By automating the identification and extraction of content from documents, organizations can put that data to work in business processes and store it in repositories, such as Box, to meet regulatory requirements.

Ingest documents directly from Datacap into Box

- Capture documents where they enter your organization to immediately begin business processes
- Automate document identification, classification and data extraction before you send them to Box
- Identify and extract business content from Box using Datacap to determine the relevant content in Box to put to work with analytics and business processes

A Capture Story

With Datacap, organizations have more options for efficiently integrating paper and digital documents into business processes virtually anywhere or anytime. You can take advantage of new solutions that turn multifunction peripherals (MFPs) and mobile devices into capture workstations while using intelligent software and networking to enable advanced document capture throughout the enterprise.

Capturing documents at the point of entry into an organization improves cycle times and customer service as the captured information can be immediately fed into business processes and repositories, such as Box.

Customer Benefits

- Capture documents where they enter your organization—in a regional office or on the road—with distributed and mobile capture
- Multi-channel capture allows for ingestion of paper and digital documents from MFPs, mobile devices, fax, email and more
- Automate the identification and classification of documents while they are captured to speed up processing times for happier customers and lower costs
- Identify and extract business content from Box for use with analytics and in business processes
